

وهذا تجميع السنة الماضية (معظم الميد و الفاينل باست ببيرز)

Final

Long term memory = hippocampus

Short term memory = Frontal lobe

judgment = prefrontal cortex

Telencephalon = cerebral cortex , It can be striatum but the Substantia Nigra which is a part of the Striatum originally from the Mesencephalon

Dopamine overactivity = Schizophrenia

Antipsychotic = Dopamine antagonist

reticular formation =(wrong) balance body it is the cerebellum the balance center

neuroreceptor =specific for neurotransmitter

Mid

Hippocampus long term memory

Not neurotransmitter thyroxine

Judgment prefrontal cortex

Part of limbic system hippocampus

Tryptophan serotonin

Dopamine not related to social phobia

Not true Neurotransmitter remain the same in the cleft with time

Nucleolus makes rDNA

Instinctual pain avoidance and pleasure

Unconscious psychoanalysis

Normlessness Anomie

Not defence mechanism deracialization

Not a characteristic of personality emotionality

emotional-1

there is significant difference in intelligence between 2 sexes.-2

instinctual behaviour-3

serotonin-4

binet 1904-5

no obligation to seek medical attention ( mkrr mrten)-6

social norms-7

rewarding to individual-8

rDNA-9

stimulate pituitary secretion-10

hippocampus-11

long term-12

prefrontal-13

remission-14  
pharmacology-15  
household occupance-16  
sex is biological ( not sure)-17  
anomie-18  
not affected by social pressure-19  
learning-20  
one object further than the other one-21  
laws of learning are the same (not sure)-22  
ry reinforcers1-23  
suggestive experience (not sure)-24  
psychoanalytic-25  
mentally represent world (eshi zy hek)-26  
binocular disperse-27  
short memory-28  
incomplete penetration-29  
increase in 30 points -30  
marital status-31  
social phobia-32
