

# SIRS, Sepsis, and MODS

Amjad Bani Hani

Asst. Prof of Cardiac Surgery and Intensive  
Care

- In 1992, the American College of Chest Physicians (ACCP) and the Society of Critical Care Medicine (SCCM) introduced definitions

## Definitions

- Infection
- Systemic Inflammatory Response Syndrome (SIRS)
- Sepsis
- Severe Sepsis
- Septic Shock

## Definitions (ACCP/SCCM):

- **Infection: A microbial phenomenon characterized by an inflammatory response to the presence of microorganisms or the invasion of normally sterile host tissue by those organisms.**

## Infection: Part of a bigger picture

- Infection:
  - Presence of organisms in a closed space or location where not normally found

## SIRS

- self-defense mechanism.
- Inflammation is the body's response to nonspecific insults that arise from chemical, traumatic, or infectious stimuli.
- The inflammatory cascade is a complex process that involves humoral and cellular responses, complement, and cytokine cascades.

## SIRS: Systemic Inflammatory Response Syndrome

- SIRS: A clinical response arising from a nonspecific insult manifested by  $\geq 2$  of the following:
  - Temperature  $\geq 38^{\circ}\text{C}$  or  $\leq 36^{\circ}\text{C}$
  - HR  $\geq 90$  beats/min
  - Respirations  $\geq 20$ /min,  $\text{Paco}_2 \geq 32$
  - WBC count  $\geq 12,000/\text{mL}$  or  $\leq 4,000/\text{mL}$  or  $>10\%$  immature neutrophils

Adapted from: Bone RC et al. *Chest*. 1992;101:1644-55.  
Opal SM et al. *Crit Care Med*. 2000;28:S81-2.

## 'Sepsis'

- Sepsis is the systemic response to infection

**SIRS** in the presence of proven or suspected infection

## Sepsis: More Than Just Inflammation

- Sepsis:
  - SIRS criteria
  - Known or suspected infection

Adapted from: Bone RC et al. *Chest*. 1992;101:1644-55.

## ‘Severe Sepsis’

- Sepsis associated with
- Organ-dysfunction
  - Hypotension
  - Hypoperfusion

## Severe Sepsis: Acute Organ Dysfunction

- Severe Sepsis = Sepsis with signs of *acute* organ dysfunction in any of the following systems:
  - Cardiovascular (septic shock)
  - Renal
  - Respiratory
  - Hepatic
  - Hemostasis
  - CNS
  - Unexplained metabolic acidosis

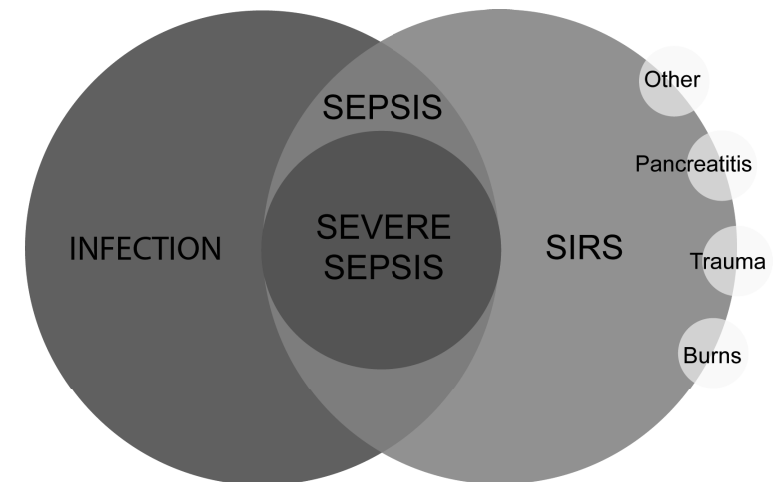

Adapted from: Bone RC et al. *Chest*. 1992;101:1644-55.

## ‘Septic Shock’

- Sepsis with hypotension despite adequate fluid resuscitation
- Include all patients on vasopressors or inotropic support

## Sepsis: A Complex Disease

Adapted from: Bone RC et al. *Chest*. 1992;101:1644-55.  
Opal SM et al. *Crit Care Med*. 2000;28:S81-2.

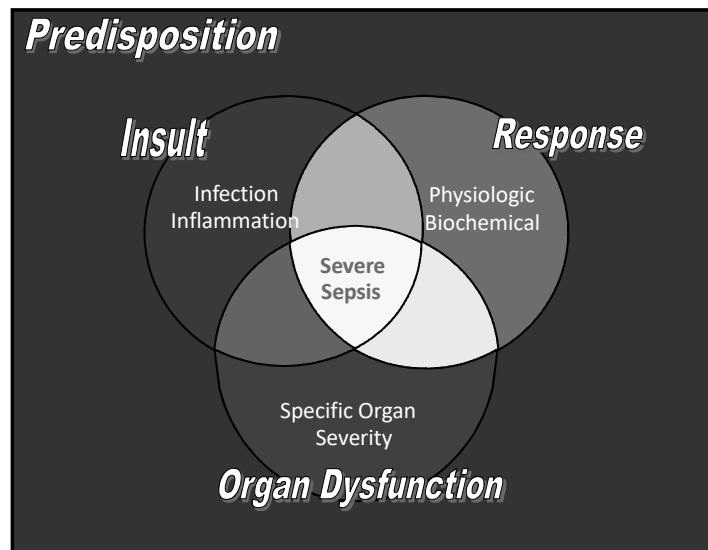

## The *Multiple Organ Dysfunction Syndrome (MODS)*

- The development of potentially reversible physiologic derangement involving two or more organ systems not involved in the disorder that resulted in ICU admission

## The *Multiple Organ Failure Syndrome (MOFS)*

- The development of potentially irreversible physiologic derangement involving two or more organ systems not involved in the disorder that resulted in ICU admission

### Jargon 2002: PIRO

### Predisposition

- Pre-existing disease
  - Cardiac, Pulmonary, Renal
  - HIV
- Age (extremes of age)
- Gender (males)
- Genetics
  - TNF polymorphisms (TNF promoter high secretor genotype)

# Response

- Physiology
  - Heart rate
  - Respiration
  - Fever
  - Blood pressure
  - Cardiac output
  - WBC
  - Hyperglycemia
- Markers of Inflammation
  - TNF
  - IL-1
  - IL-6
  - Procalcitonin
  - PAF

## IDENTIFYING ACUTE ORGAN DYSFUNCTION AS A **MARKER** OF SEVERE SEPSIS

## Organ Dysfunction

- Lungs ➤ Adult Respiratory Distress Syndrome
- Kidneys ➤ Acute Tubular Necrosis
- CVS ➤ Shock
- CNS ➤ Metabolic encephalopathy
- PNS ➤ Critical Illness Polyneuropathy
- Coagulation ➤ Disseminated Intravascular Coagulopathy
- GI ➤ Gastroparesis and ileus
- Liver ➤ Cholestasis
- Endocrine ➤ Adrenal insufficiency
- Skeletal Muscle ➤ Rhabdomyolysis

## Magnitude of the Problem

✓ Specific therapy exists

## Comparison With Other Major Diseases

- Severe sepsis takes more lives than breast, colon/rectal, pancreatic, and prostate cancer combined.
- One of every three patients who develop severe sepsis will die within a month.

Source: Society of Critical Care

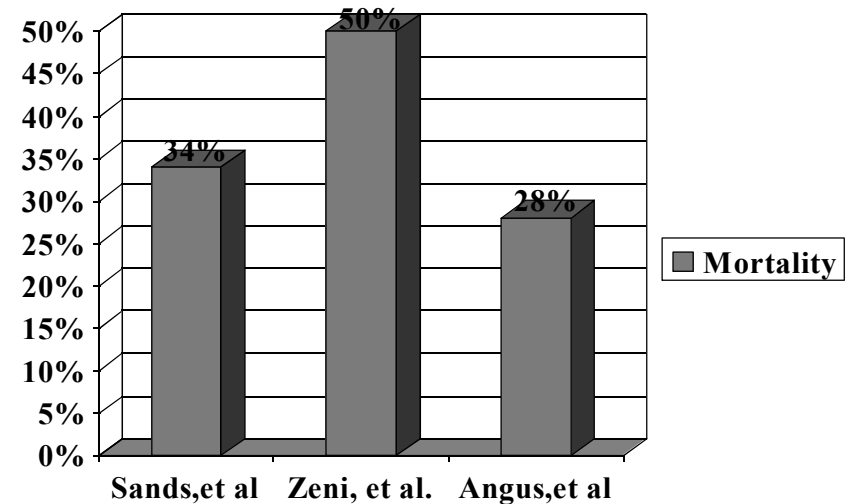

<sup>†</sup>National Center for Health Statistics, 2001. <sup>§</sup>American Cancer Society, 2001. <sup>\*</sup>American Heart Association, 2000. <sup>‡</sup>Angus DC et al. *Crit Care Med.* 2001;29(7):1303-1310.

## Sepsis, Mortality Rates

- Overall = 30% - 50%
- By syndrome definition:
  - SIRS = 4- 7%
  - Sepsis = 16%
  - Severe sepsis = 20%
  - Septic shock = 46%

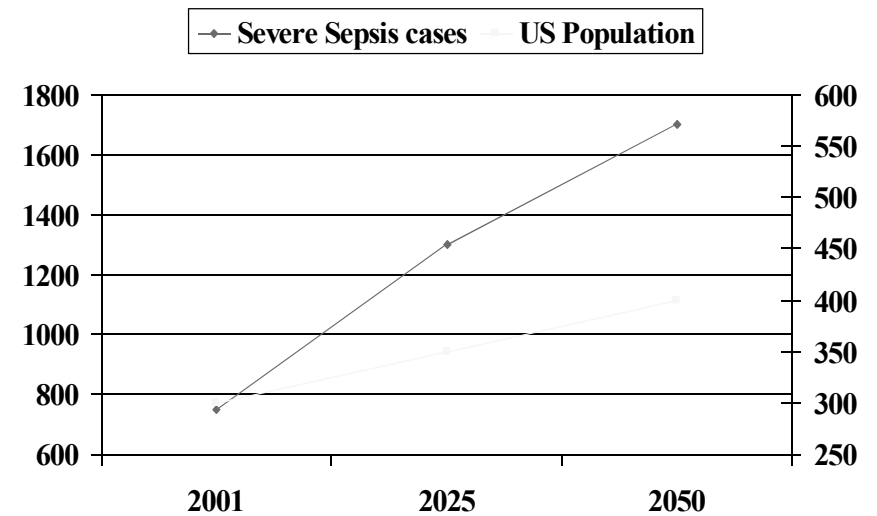

## Severe Sepsis is deadly

## Severe Sepsis is Common

## Severe Sepsis is increasing in incidence

## Epidemiology of Sepsis The International Cohort Study

Infection	Sepsis	Severe Sepsis	Septic Shock
-----------	--------	---------------	--------------

Percent of cases within each category

18	28	24	30
35% mortality			

8353 patients with LOS > 24h  
4277 infections (2696 on admission)

Alberti, Int Care Med 2002

## Sources of Sepsis The International Cohort Study

	Severe Sepsis	Septic Shock
Respiratory	66	53
Abdomen	9	20
Bacteremia	14	16
Urinary	11	11
Multiple	-	-

# Microbiology of Sepsis

## The International Cohort Study

	Severe Sepsis	Septic Shock
Gram-positive	44	40
Gram-negative	47	47
Fungal	9	13
Polymicrobial	-	-

## Etiology

- Infectious
- Non-Infectious

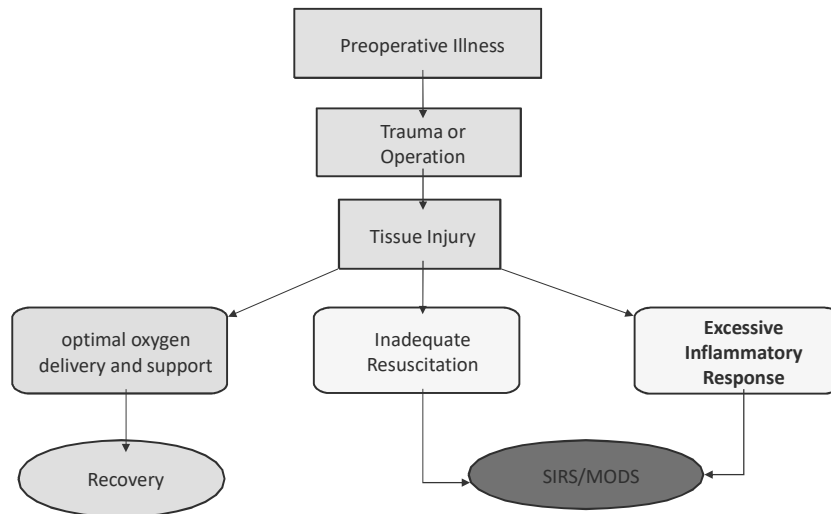

## Infectious

- Bacterial sepsis
- Burn wound infections
- Candidiasis
- Cellulitis
- Cholecystitis
- Community-acquired pneumonia<sup>[3]</sup>
- Diabetic foot infection
- Erysipelas
- Infective endocarditis
- Influenza
- Intraabdominal infections -  
Eg, diverticulitis, appendicitis
- Gas gangrene
- Meningitis
- Nosocomial pneumonia
- Pseudomembranous colitis
- Pyelonephritis
- Septic arthritis
- Toxic Shock Syndrome
- Urinary tract infections (male and female)

## Noninfectious

- Acute mesenteric ischemia
- Adrenal insufficiency
- Autoimmune disorders
- Burns
- Chemical aspiration
- Cirrhosis
- Cutaneous vasculitis
- Dehydration
- Drug reaction
- Electrical injuries
- Erythema multiforme
- Hemorrhagic shock
- Hematologic malignancy
- Intestinal perforation
- Medication side effect - Eg, from theophylline
- Myocardial infarction
- Pancreatitis<sup>[4]</sup>
- Seizure
- Substance abuse - Stimulants such as cocaine and amphetamines
- Surgical procedures
- Toxic epidermal necrolysis
- Transfusion reactions
- Upper gastrointestinal bleeding
- Vasculitis

# Pathogenesis of SIRS/MODS

# Initiation of Inflammatory Response

From Wheeler & Bernard, NEJM 1999

## Pro-inflammatory Mediators

- Bacterial Endotoxin
- TNF- $\alpha$
- Interleukin-1
- Interleukin-6
- Interleukin-8
- Platelet Activating Factor (PAF)
- Interferon-Gamma
- Prostaglandins
- Leukotrienes
- Nitric Oxide

## Anti-inflammatory Mediators

- Interleukin-10
- PGE2
- Protein C
- Interleukin-4
- Interleukin-12
- Lipoxins
- GM-CSF
- TGF
- IL-1RA

## Pathophysiology of Sepsis

- In simple terms sepsis can be viewed as an imbalance of inflammation, coagulation, and fibrinolysis.
- In normal patients homeostasis is maintained when these are balanced.

## Pathophysiology of Sepsis

During a normal response to bacteria in the blood the immune system releases inflammatory mediators to promote recovery of the tissue.

These mediators are known as:

- Tumor Necrosis Factor (TNF)
- Interleukins (IL)
- Cytokines
- Prostaglandins
- Platelet Activating Factor

Source: New England Journal of Medicine, 2003

## Pathophysiology of Sepsis

Once the bacteria or antigen is isolated, the pro-inflammatory mediators attract neutrophils or WBCs which attack the antigen and try to engulf it.

Graphics: Delores Zittel, 2006

## Pathophysiology of Sepsis

To prevent the response from damaging normal tissue, **anti-inflammatory** mediators are released including transforming growth factors and interleukins (IL-4). This balance of inflammatory and anti-inflammatory mediators restricts the inflammation response to the local site of infection.

supplement, 2004

## The Compensatory Anti-inflammatory Response syndrome (CARS) in Critically ill patients

Nicholas S. Ward, MD<sup>a,\*</sup>, Brian Casserly, MD<sup>a</sup>, and Alfred Ayala, PhD<sup>b</sup>

<sup>a</sup>Division of Pulmonary, Critical Care, and Sleep Medicine, The Warren Alpert Medical School of Brown University, 593 Eddy Street, APC 707, Providence, RI 02912, USA

<sup>b</sup>Division of Surgical Research, Department of Surgery, The Warren Alpert Medical School of Brown University, Providence, RI 02912, USA

### Cellular/molecular elements

Lymphocyte dysfunction (ie, reduced proliferative and/or type 1 helper T-cell [Th1] cytokine production in response-defined antigens or specific T-cell stimuli)

Lymphocyte Apoptosis

Down-regulation of monocyte HLA receptors Monocyte deactivation (ie, reduced Th1/proinflammatory cytokine production in response stimuli)

IL-10 production

Transforming growth factor-beta production Prostaglandin E2 production

## Molecular Mediators in Pathophys

- Parallel to SIRS is CARS
  - Compensatory Anti-inflammatory Response System
    - Attempts to down regulate the SIRS response
    - IL-4, IL-10, transforming growth factor beta, CSF, soluble receptors to TNF, antagonists to TNF-alpha and IL-1
    - If CARS reaction is severe it will manifest as anergy and infection susceptibility

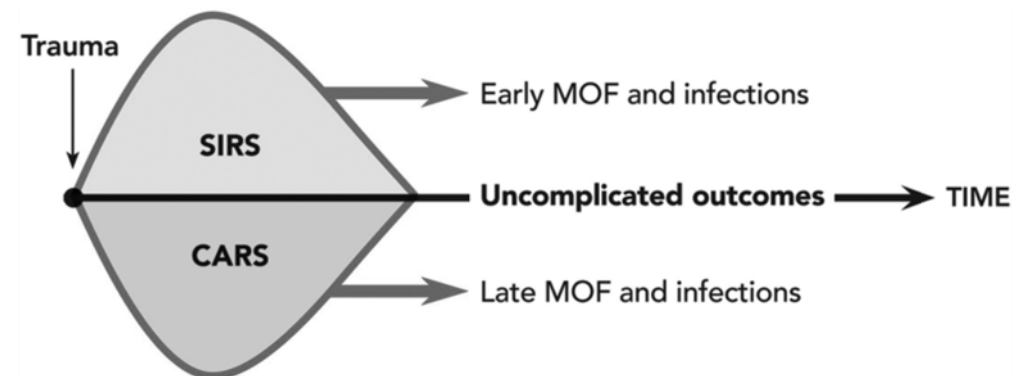

Figure Legend:

Fig. 2. Trauma-induced injury activates innate immune responses to produce pro- and antiinflammatory cytokines. Imbalance between the systemic inflammatory response syndrome and the compensatory antiinflammatory response (immunosuppression) increases morbidity of trauma patients. In the first hours, the magnitude of the systemic inflammatory response syndrome is correlated with early multiple organ failure and infections. In the following days, immunosuppression contributes to the increased incidence of nosocomial infections and late sepsis. CARS = compensatory anti-inflammatory response; MOF = multiple organ failure; SIRS = systemic inflammatory response syndrome.

# Pathophysiology of Sepsis

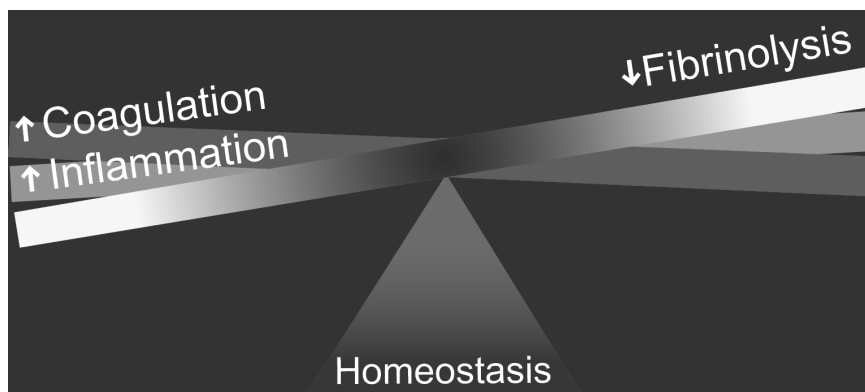

When the body is unable to maintain the appropriate balance, the immune response is no longer local but becomes systemic.

Inflammation and altered clotting quickly spread through the body.

pplement, 2004

## Homeostasis Is Unbalanced in Severe Sepsis

Carvalho AC, Freeman NJ. *J Crit Illness*. 1994;9:51-75; Kidokoro A et al. *Shock*. 1996;5:223-8; Vervloet MG et al. *Semin Thromb Hemost*. 1998;24:33-44.

# Pathophysiology of Sepsis

- The release of the inflammatory mediators starts the Coagulation Cascade leading to the development of a clot.
- To maintain this clot, inhibitors are released to suppress fibrinolysis or breakdown. This is necessary to have time for the body to destroy the bacteria before the clot is gone.

Source: Critical Care Nurse Supplement, 2004

## Activation of Coagulation

The enhanced clotting continues making tiny clots or “microthrombi” in the vascular system which impairs blood flow and organ perfusion.

## Activation of Fibrinolysis

Fibrinolysis, or the breakdown of clots, is the body's response to the increased clotting and inflammation.

In sepsis this breakdown is inhibited or slowed through

- Plasminogen Activator Inhibitor-1 (PAI-1)
- Thrombin Activatable Fibrinolysis Inhibitor (TAFI)

## Activation of Fibrinolysis

The increase levels of these two inhibitors, Plasminogen Activator Inhibitor-1 (PAI-1) and Thrombin Activatable Fibrinolysis Inhibitor (TAFI), suppress fibrinolysis even more creating a state of “coagulopathy”.

### SEVERE SEPSIS PATHOPHYSIOLOGY

Microvascular  
dysfunction

→ Hypoperfusion/hypoxia → Organ dysfunction

## Making Matters Worse The Role of Endothelium in Sepsis

Normal endothelium has anticoagulant abilities and plays a role in the body's homeostasis abilities including:

- Vasomotor tone
- Movement of cells and nutrients
- Maintaining blood fluidity

When activated, endothelium also plays a role in the inflammatory, coagulation, and fibrinolytic components of sepsis.

## Making Matters Worse

- In sepsis the endothelium becomes damaged which makes the “inflammatory process” worse by releasing more cytokines (TNF-a and IL-1) causing neutrophils to stick to its’ lining.
- The “activation” of the capillary endothelium leads to increased permeability causing fluid to “leak” out of the capillaries and into the extracellular spaces.

Source: [http://www.xigris.com/Learning\\_Modules/course\\_01/module\\_02/index.htm](http://www.xigris.com/Learning_Modules/course_01/module_02/index.htm)

## Organ Failure and Mortality

•Knaus, et al. (1986):

•Direct correlation between number of organ systems failed and mortality.

•Mortality Data:

#OSF	D1	D2	D3	D4	D5	D6	D7
1	22%	31%	34%	35%	40%	42%	41%
2	52%	67%	66%	62%	56%	64%	68%
3	80%	95%	93%	96%	100%	100%	100%

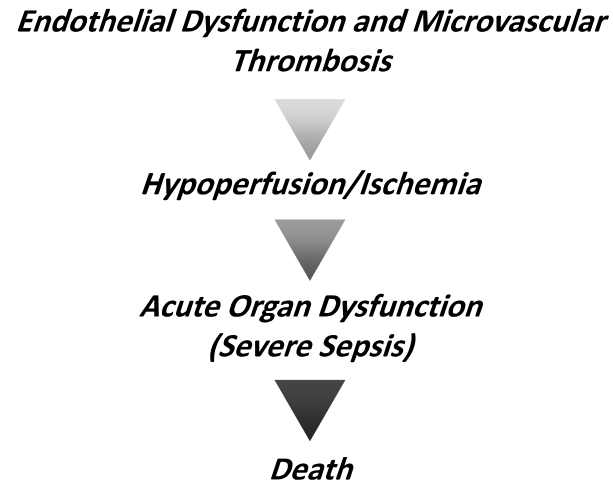

## Question: Why do Septic Patients Die?

- **Answer: Organ Failure**

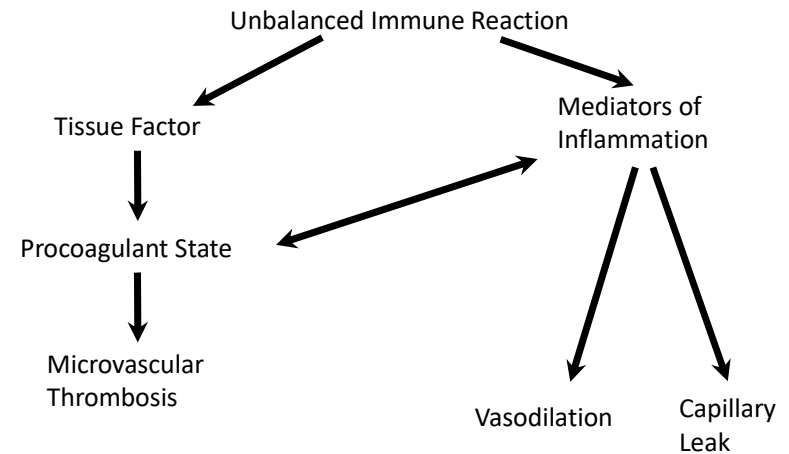

SEVERE SEPSIS-ASSOCIATED MORTALITY INCREASES WITH THE NUMBER OF ORGAN DYSFUNCTIONS

# Severe Sepsis: The Final Common Pathway

# Sepsis Pathogenesis

## System-based Approaches to sepsis

How do you Quickly deliver complex care?

Mobilization and coordination of people and resources.

The New England Journal of Medicine

### EARLY GOAL-DIRECTED THERAPY IN THE TREATMENT OF SEVERE SEPSIS AND SEPTIC SHOCK

EMANUEL RIVERS, M.D., M.P.H., BRYANT NGUYEN, M.D., SUZANNE HAVSTAD, M.A., JULIE RESSLER, B.S., ALEXANDRIA MUZZIN, B.S., BERNHARD KNOBLICH, M.D., EDWARD PETERSON, Ph.D., AND MICHAEL TOMLANOVICH, M.D., FOR THE EARLY GOAL-DIRECTED THERAPY COLLABORATIVE GROUP\*

## System-based Approaches to sepsis

### ■ Early-Goal Directed Therapy

Hospital-wide impact of a standardized order set for the management of bacteremic severe sepsis

BEFORE

AFTER

Do whatever it is that you normally do. We will be watching.

All physicians, nurses, and patient care technicians in the emergency department and intensive care units received formal order set clinical education. Additionally, all hospital floor clinical nurse specialists and advance practice nurses, along with the house staff physicians in these areas, were in-serviced on the order sets...These educational endeavors included training in sepsis pathophysiology, monitoring of central venous pressures, assessment of central venous blood oxygen saturation, and the pharmacotherapy of sepsis

- 1. EDUCATION
- 2. ORDER SET with recommendations and goals for sepsis treatment.

Thiel, S. W., Asghar, M. F., Micek, S. T., Reichley, R. M., Doherty, J. A., & Kollef, M. H. (2009). Hospital-wide impact of a standardized order set for the management of bacteremic severe sepsis. *Critical Care Medicine*, 37(3), 819–824. doi:10.1097/CCM.0b013e318196206b

Absolute Change in Mortality	-16%	-12%	-19%	-16%	-7%

## Acute Phase

- Identify Sepsis as early as possible
- Broad Spectrum antibiotics ASAP and Identify source(s) of infection
- Identify severity: Vitals, mental status, UOP, LACTATE, other labs.
- Volume and physiologic resuscitation ASAP with GOALS.
- Tweak your system so these things happen FAST

## Sepsis Identification

- Train all providers
- Vital sign/Laboratory alerting systems
- ?Biomarkers

## Antibiotics

- No randomized-controlled data

Gaieski DF, Mikkelsen ME, Band RA, et al. Impact of time to antibiotics on survival in patients with severe sepsis or septic shock in whom early goal-directed therapy was initiated in the emergency department\*. *Critical Care Medicine* 2010;38(4):1045-53.

Time from hypotension to appropriate ABX

Kumar A, Roberts D, Wood KE, et al. Duration of hypotension before initiation of effective antimicrobial therapy is the critical determinant of survival in human septic shock\*. *Critical Care Medicine* 2006;34(6):1589-96.

## Source Control

- Don't be satisfied with a diagnosis of sepsis and no source.
- If a source exists and is potentially removable, get the ball rolling.

## Defining the severity of sepsis

- Importance of looking for organ failure is self evident.
- Identification of “shock” dramatically alters the treatment and mortality.
- Blood Pressure, Response to Fluid, LACTATE

## Goals in resuscitation

- Early, quantitative resuscitation goals vs. standard care have resulted in improved mortality

The effect of a quantitative resuscitation strategy on mortality in patients with sepsis: A meta-analysis \*. Jones, Alan E. MD; Brown, Michael D. MD, MSc; Trzeciak, Stephen MD, MPH; Shapiro, Nathan I. MD, MPH; Garrett, John S. MD; Heffner, Alan C. MD; Kline, Jeffrey A. MD; on behalf of the Emergency Medicine Shock Research Network investigators *Critical Care Medicine*. 36(10):2734-2739, October 2008.

## Surviving Sepsis targets of fluid resuscitation

What are they?

- SBP
- MAP
- CVP
- U/o
- Lactate
- ScvO<sub>2</sub>
- Hct

## Surviving Sepsis targets of fluid resuscitation

What are they?

- SBP > 90
- MAP > 65
- CVP 8 - 12
- U/o > 0.5 ml/kg/hr
- Lactate < 1
- ScvO<sub>2</sub> > 70
- Hct > 30

## Resuscitation

- Crystalloids are favored as the initial fluid
- Hydroxyethyl starches are likely harmful
- Albumin may have a role, particularly if a lot of fluid is given

## Chronic Phase

- Monitor for and prevent recurrence of sepsis
  - VAP, CLABSI, UTI. Infection Control Practices.
- Lung Protective Ventilator Strategies
- Protocolized Sedation, Daily Awakenings
- Nutritional Support
- Early Mobilization
- Success with these measures is most likely with a multi-disciplinary approach.

## Summary

- System-based strategies are effective for improving sepsis care
- Processes should aim to:
  - Identify patients early and identify the severity of sepsis
  - Quickly administer appropriate antibiotics and source control
  - Establish institutional goals for physiologic resuscitation
  - Multidisciplinary chronic phase of care to ensure compliance

## Oxygen delivery

What does it mean?

## How do we manage sepsis and septic shock?

- 1) Investigate and treat sepsis
  - Try and find and treat source
  - Early blood cultures
  - Start antibiotics asap ideally within 1 hour and after cultures taken
- 2) Assess extent of end organ hypoperfusion and improve oxygen delivery (early goal directed therapy)

## Oxygen delivery

What does it mean?

$$\begin{aligned}\text{Delivery (DO}_2\text{)} &= \text{O}_2 \text{ content} \times \text{cardiac output} \\ &= ([\text{Hb}] \times \text{SpO}_2 \times 1.34) \times (\text{HR} \times \text{SV})\end{aligned}$$

$$\text{Oxygen content} = [\text{Hb}] \times \text{SpO}_2 \times 1.34$$

$$\text{Cardiac output} = \text{HR} \times \text{SV}$$

## Fluid Challenge

What is the difference between an infusion and a challenge?

## Fluid Challenge

What is the difference between an infusion and a challenge?

250 to 500 ml colloid (or blood products)

500 to 1000ml Hartmann's

[NOT 5% dextrose]

As fast as possible (with pressure bag)

You at the bedside

## Fluid Challenge

Aim is to improve SV (and hence CO) by increasing preload

Frank-Starling mechanism

## Markers of perfusion

What are they?

# Markers of perfusion

What are they?

- Clinical signs
  - Warm skin, conscious level, u/o
- Haemodynamic variables
  - CVP
- Bloods
  - Serum Lactate
  - ScvO<sub>2</sub>

## CVP

What does it mean?

## CVP

What does it mean?

Starling's Law

Estimate of LVEDV (i.e. preload)

Not always a good correlation with volume-responsiveness

However if low strongly suggestive of hypovolaemia

## Lactate

What does it mean?

## Lactate

What does it mean?

- Increased production (anaerobic glycolysis)
  - Tissue hypoperfusion
  - Tissue dysoxia
- Reduced metabolism
  - Hepatic
  - Renal
- <1 is normal, 1-2 is a concern, >2 is bad, >4 is very bad

## ScvO<sub>2</sub>

What does it mean?

## ScvO<sub>2</sub>

What does it mean?

- Balance between oxygen delivery and consumption (VO<sub>2</sub>)
- $$\text{ScvO}_2 = \text{SaO}_2 - \frac{\text{VO}_2}{\text{CO}}$$
- Target > 70%

## ScvO<sub>2</sub>

What can I do if it's low?

## ScvO<sub>2</sub>

What can I do if it's low?

Delivery = [Hb] x SpO<sub>2</sub> x 1.34 x HR x SV

## ScvO<sub>2</sub>

What can I do if it's low?

Delivery = [Hb] x SpO<sub>2</sub> x 1.34 x HR x SV

Fluid optimise

Transfuse packet cells

Hct > 30%

Inotropes

## “Time Zero”

- Time Zero = time of presentation
  - ED, Medical Floors, ICU
- Both bundles time based
- Most important time based elements:
  - Antibiotic timing
  - Resuscitation timing (EGDT)

## Antibiotic therapy

1. We recommend that intravenous antimicrobial therapy be started as early as possible and within the first hour of recognition of septic shock (1B) and severe sepsis without septic shock (grade1C).

## Hospital Mortality by Time to Antibiotics

Time to ABX <sup>1</sup> , hrs	OR <sup>2</sup>	95% CI		p-value	Probability of mortality <sup>3</sup>	95% CI	
0 (ref)	1.00	---	---	---	18.7	17.5	19.9
1	1.05	1.02	1.07	< 0.001	19.3	18.3	20.4
2	1.09	1.04	1.15	< 0.001	20.0	19.1	21.0
3	1.14	1.06	1.23	< 0.001	20.8	19.7	21.8
4	1.19	1.08	1.32	< 0.001	21.5	20.3	22.8
5	1.25	1.11	1.41	< 0.001	22.3	20.7	23.9
6	1.31	1.13	1.51	< 0.001	23.1	21.2	25.1

<sup>1</sup>Time to ABX is based on 15,948 observations that are greater than or equal to zero

<sup>2</sup>Hospital mortality odds ratio referent group is 0 hours for the time to ABX and is adjusted by the number of baseline organ failures, infection type (community vs. nosocomial), and geographic region (Europe, North America, and South America)

## Fluid therapy

4. We recommend that initial fluid challenge in patients with sepsis-induced tissue hypoperfusion with suspicion of hypovolemic be started with  $\geq 1000$  mL of crystalloids (to achieve a minimum of 30ml/kg of crystalloids in the first 4 to 6 hours). (Grade 1B).

## Logistic Regression Model

Compliance indicator	Hospital mortality odds ratio <sup>1</sup>	95% CI	p-value
1. Serum lactate within 6 hours	0.71	0.67 – 0.75	< 0.001
2. Blood cultures before antibiotics	0.81	0.76 – 0.86	< 0.001
3. Broad spectrum antibiotics	0.83	0.79 – 0.88	< 0.001
4. Fluids and vasopressors	0.57	0.54 – 0.61	< 0.001
5. CVP ≥ 8 mm Hg within 6 hours	0.74	0.69 – 0.79	< 0.001
6. ScvO <sub>2</sub> ≥ 70% within 6 hours	0.73	0.67 – 0.78	< 0.001
7. Resuscitation bundle	0.77	0.72 – 0.83	< 0.001
8. Low-dose steroids policy	0.82	0.77 – 0.88	< 0.001
9. Drotrecogin alfa policy	0.93	0.88 – 0.98	0.008
10. Glucose control maintained	0.70	0.69 – 0.74	< 0.001
11. IPP < 30 cm H <sub>2</sub> O	0.78	0.71 – 0.86	< 0.001
12. Management bundle	0.72	0.68 – 0.77	< 0.001
High resuscitation performance	0.79	0.75 – 0.83	< 0.001
High management performance	0.84	0.80 – 0.88	< 0.001

## SSC Bundle:

TO BE COMPLETED WITHIN 6 HOURS OF TIME OF PRESENTATION:

5. Apply vasopressors (for hypotension that does not respond to initial fluid resuscitation to maintain a mean arterial pressure (MAP) ≥65mmHg)
6. In the event of persistent arterial hypotension despite volume resuscitation (septic shock) or initial lactate ≥4 mmol/L (36mg/dl):
  - Measure central venous pressure (CVP)\*
  - Measure central venous oxygen saturation (ScvO<sub>2</sub>)\*
7. Remeasure lactate\*

\* Targets for quantitative resuscitation included in the guidelines are CVP of ≥8 mm Hg, ScvO<sub>2</sub> of ≥70% and lactate normalization.

## SSC Bundle:

TO BE COMPLETED WITHIN 3 HOURS OF TIME OF PRESENTATION <sup>†</sup>:

1. Measure lactate level
2. Obtain blood cultures prior to administration of antibiotics
3. Administer broad spectrum antibiotics
4. Administer 30ml/kg crystalloid for hypotension or lactate ≥4mmol/L

<sup>†</sup> “time of presentation” is defined as the time of triage in the Emergency Department or, if presenting from another care venue, from the earliest chart annotation consistent with all elements severe sepsis or septic shock ascertained through chart review.

## The Importance of Early Detection

- Efforts to **just treat recognized sepsis** alone are incomplete
- A critical aspect of mortality reduction in the Campaign has been pushing practitioners to identify sepsis early.
  - Levy MM, Dellinger RP, Townsend SR, et al. The Surviving Sepsis Campaign: Results Of An International Guideline-Based Performance Improvement Program Targeting Severe Sepsis. Crit Care Med. 2010 Feb;38(2):367-74.
- It may well be that earlier recognition accounts for much of the signal in mortality reduction and partially explains sharply increasing incidence.
  - Gaieski DF, Edwards JM, Kallan MJ, et al. Benchmarking the Incidence and Mortality of Severe Sepsis in the United States. Crit Care Med. 2013 Feb 25. [Epub ahead of print]
- Without recognition that the clock is ticking, there is simply no incentive to recognize a challenging diagnosis early.

# 6 Hour Resuscitation Bundle

- Early Identification
- Early Antibiotics and Cultures
- Early Goal Directed Therapy

## Rhode Island Hospital EGDT Data

Time from Entering ED  
to Receiving Antibiotics

Reduced by 42%

Time from Entering ED  
to Catheter Insertion

Reduced by 60%

Time from Entering ED  
to Transfer to MICU

Reduced by 51%
